

SYN FLOOD Network Incident Report

(WIRESHARK MONITORING)

Section 1: Identify the type of attack that may have caused this network interruption

One potential explanation for the website's connection timeout error message is:

The logs show that: IP 203.0.113.0 is attempting multiple requests every few seconds which is abnormal.

This event could be: Most likely a DOS attack using the TCP SYN FLOOD method.

Section 2: Explain how the attack is causing the website to malfunction

When website visitors try to establish a connection with the web server, a three-way handshake occurs using the TCP protocol. Explain the three steps of the handshake:

1. SYN
2. SYN - ACK
3. ACK

Explain what happens when a malicious actor sends a large number of SYN packets all at once: Too many requests can flood the server making it unreachable or unusable.

Explain what the logs indicate and how that affects the server: The logs started off with normal employee requests until the IP 203.0.113.0 began to flood the server with SYN requests eventually taking over and making the system unresponsive.
